File Organization Technique- Single and Two level directory.

AIM:

To implement File Organization Structures in C are a. Single Level Directory

- b. Two-Level Directory
- c. Hierarchical Directory Structure
- d. Directed Acyclic Graph Structure

a. Single Level Directory

ALGORITHM

- 1. Start
- 2. Declare the number, names and size of the directories and file names.
- 3. Get the values for the declared variables.
- 4. Display the files that are available in the directories.
- 5. Stop.

PROGRAM:

```
#include <stdio.h>
#include <string.h>

struct File {
  char name[20];
  };

int main() {
  int n, i;
  struct File files[50];
  printf("Enter the Number of files: ");
  scanf("%d", &n);

// Flush newline character left in buffer getchar();

for (i = 0; i < n; i++) {</pre>
```

```
printf("Enter the file%d: ", i + 1);
fgets(files[i].name, sizeof(files[i].name), stdin); //
Remove newline character
files[i].name[strcspn(files[i].name, "\n")] = '\0'; }
printf("\n--- Single Level Directory Structure ---\n");
printf("Root Directory\n");
for (i = 0; i < n; i++)
printf(" \mid n --> %s \mid n", files[i].name); }
return 0;
       OUTPUT:
       Linter the Number of files
       Enter the file1 J
                                   Root Directory.
       Enter the file2 B
                                   Root Directory
```

b. Two-level directory Structure

ALGORITHM:

- 1. Start
- 2. Declare the number, names and size of the directories and subdirectories and file names.

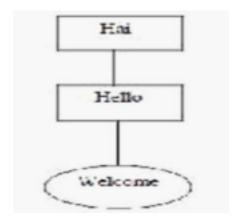

- 3. Get the values for the declared variables.
 - 4. Display the files that are available in the directories and subdirectories.
- 5. Stop.

PROGRAM:

```
#include <stdio.h>
#include <string.h>
int main() {
char root[20], subdir[20], file[20];
printf("Enter the name of dir/file(under null): ");
scanf("%s", root);
printf("How many users(for %s): ",
root); int n;
scanf("%d", &n);
for (int i = 0; i < n; i++) {
printf("Enter name of dir/file(under %s):", root);
scanf("%s", subdir);
printf("How many files(for %s):",
subdir); int m;
scanf("%d", &m);
for (int j = 0; j < m; j++) {
printf("Enter name of dir/file(under %s):", subdir);
scanf("%s", file);
}
// Simple display like the
image printf("\n%s\n",
root); printf(" |\n%s\n",
subdir); printf(" |\n%s\n",
file);
}
return 0;
Sample Output:
Enter the name of dir/file(under null): Hai
```

How many users(for Hai):1
Enter name of dir/file(under Hai):Hello

How many files(for Hello):1 Enter name of dir/file(under Hello):welcome

Result:

Thus the algorithm is executed successfully.
